BrainsWay **OCD**
For treatment of
obsessive-compulsive disorder

BrainsWay ^{OCD}

An effective treatment for OCD that is quick, safe and personalized

If you've been diagnosed with obsessive-compulsive disorder (OCD) and are currently being treated with medication or psychotherapy, BrainsWay ^{OCD} may offer an additional treatment option to help you achieve wellbeing.

With each therapy session lasting approximately 18 minutes, the treatment can fit easily into your schedule. The treatment has minimal side effects, and is personalized for your specific OCD symptoms.

It really does save lives

Before Treatment

"In social situations I just wasn't myself and didn't know it...I wasn't well. I was extremely nervous, repetitive and couldn't sleep".

After BrainsWay OCD Treatment

"I have never experienced anything like that...**It was miraculous...I feel like a new person.** I regained my confidence".

-Cathy, OCD patient treated with BrainsWay OCD

Q&A

How effective is BrainsWay ^{OCD} ?

In a large multicenter study, 38% of patients achieved a substantial 30% reduction in symptoms. 55% of patients achieved over 20% reduction in symptoms.

I have already tried other medications and had poor results - will BrainsWay ^{OCD} be any better?

Studies have shown the treatment to be effective for patients with OCD who have failed to respond to or could not tolerate medication. Patients in the BrainsWay ^{OCD} clinical study were maintained on existing medication and psychotherapy, but many had not experienced relief until TMS treatment was provided.

Has BrainsWay ^{OCD} been tested?

BrainsWay ^{OCD} uses Deep TMS technology, which has been tested in over 60 clinical studies for various indications in leading institutions worldwide. The FDA has cleared this technology for clinical use in Obsessive-Compulsive Disorder and it is currently available in the US, Europe, and South America.

How does the treatment work?

The treatment integrates seamlessly into your routine. Prior to TMS, your physician will design a personalized protocol based on your specific OCD symptoms. During each session, you will be comfortably seated on a chair with a cushioned, air-cooled helmet placed over your head. The helmet uses magnetic fields to stimulate the targeted brain region and improve OCD symptoms. The procedure requires daily sessions of 18 minutes for 6 weeks. As the treatment is done in an outpatient setting with no anesthesia, and entails no systemic side effects, you can return to your normal routine after each session.

Does the treatment entail any discomfort?

BrainsWay ^{OCD} is a non-invasive, outpatient procedure. Patients may experience headaches or minor pain at the site of treatment. However, these side effects are typically brief and cease after the first few sessions. Your physician will tailor the treatment parameters to minimize any discomfort.

Safety Information: Patients should consult with their doctor before undergoing BrainsWay ^{OCD} . The most common side effects include headaches and application site pain or discomfort. There is also a very rare risk of seizure associated with the treatment. Patients with metal in or around the head such as in metal plates, implants and stents, should not undergo Deep TMS treatment.

Indication: BrainsWay Deep TMS is indicated by the FDA as an intended adjunct treatment for adult patients suffering from Obsessive-Compulsive Disorder (OCD). FDA De Novo No. DEN170078
